Convolutional Codes

This encoder depicted in the figure below corresponds to the following **generator polynomials**:

$$\begin{aligned} g^{(1)} &= 1 + x^2 & g^{(2)} &= 1 + x + x^2 \\ g^{(1)} &= [1, 0, 1] & g^{(2)} &= [1, 1, 1] \end{aligned} \tag{1}$$

Figure: Convolutional encoder with rate $R = \frac{1}{2}$ and constraint length $K = 2$

Finite State Machine

Other representations of this encoder are a **finite state machine** and a **trellis**.

Figure: FSM representation

Figure: Trellis representation

The single digit on each edge indicates the input bit and the two digits indicates the output according to the generator polynomials.

The Viterbi Decoder

Goal

Determine the **most likely** sequence of states that could have produced the given sequence of received bits

Using the trellis representation of the encoding process, the Viterbi decoder determines the **most likely path** along this trellis.

Table of Contents

Goal and Motivation

Table of Contents

- 1 Background
 - Convolutional Codes
 - Finite State Machine
 - The Viterbi Decoder
- 2 Goal and Motivation
- 3 Tools
 - `scikit-dsp-comm`
- 4 Our Model
 - RNN (?)
- 5 Results
- 6 References
